What do we
do?

 meribia

Index

Introduction

What is needed?

How is it deployed?

The hidden face

Conclusions

In business :

In a bank transaction we find three contracts and a third party of trust.

Information and merchandise travel together.

What are trusted third parties?

In business :

In an exchange of goods, basic, we find again three contracts :

Information and merchandise do **not** travel together,
therefore, subject to possible imperfections.

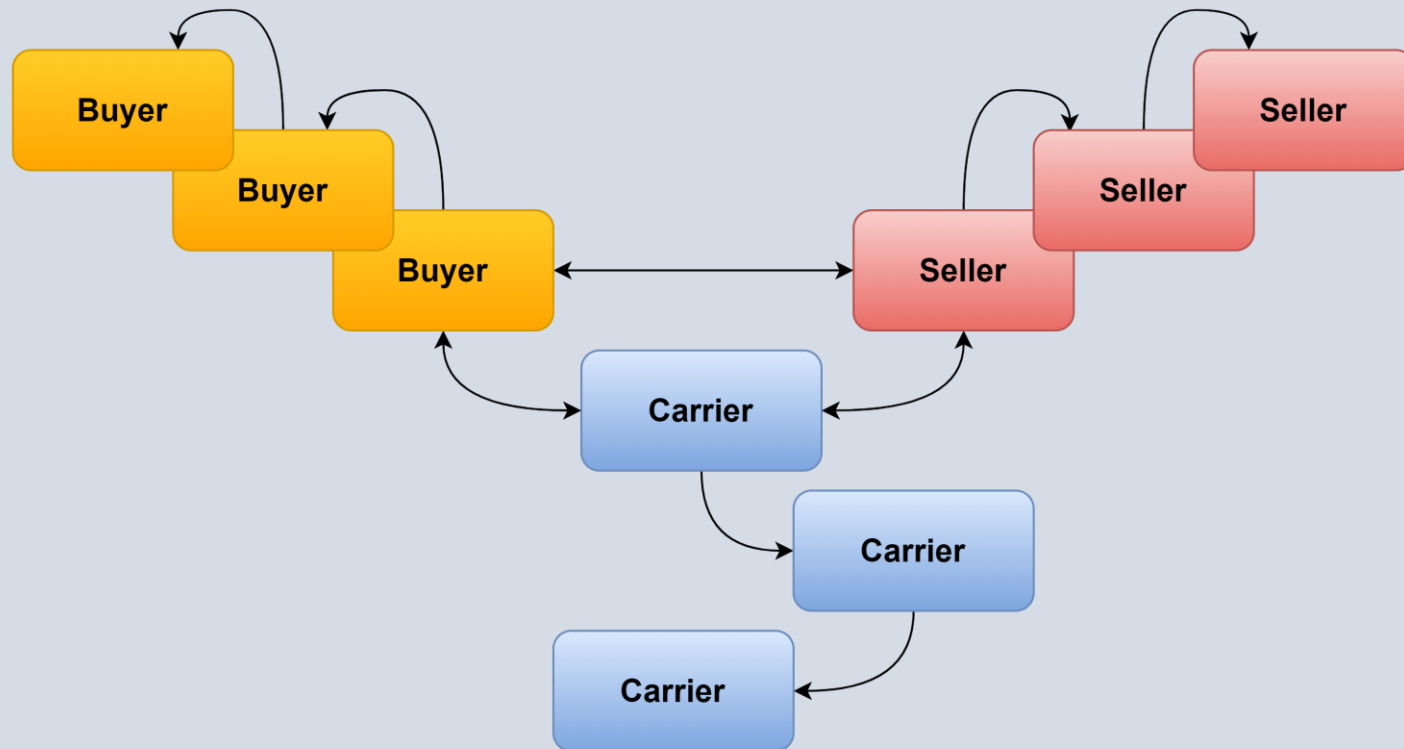

Three computer systems are
replicating the same information.

In business :

In a complex exchange of goods, we can find many contracts :

Multiple computer systems are replicating the same information.

Solution 1: Marketplace

The third part of trust for everyone is **Meribia**.

Multiple contracts can happen in the same system achieving :

- Transparency
- Immutability
- Centralization

Multiple contracts are hosted in the same computer system.

Solution 2: Contracts without a trusted third party.

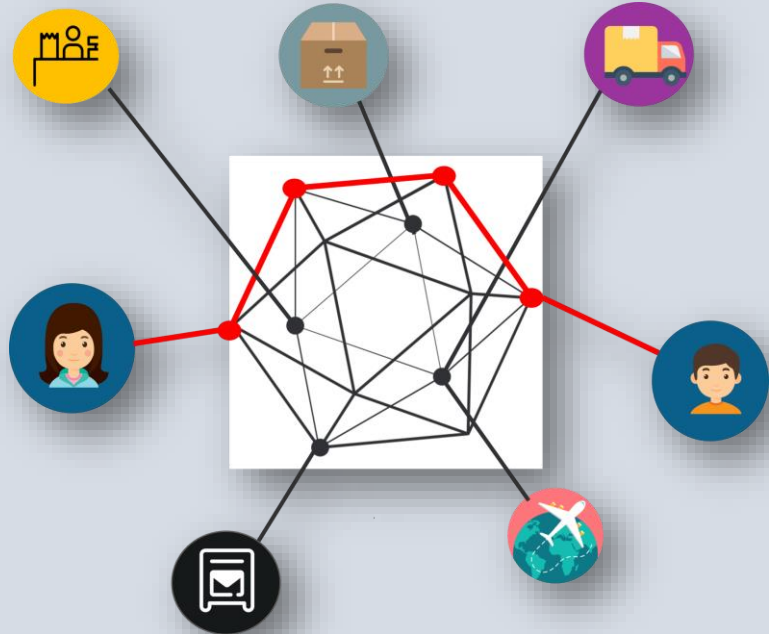

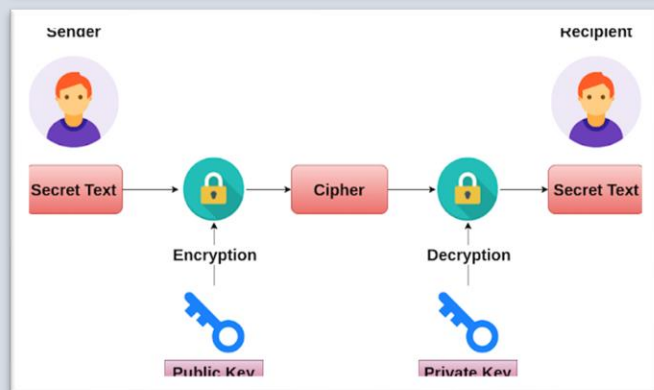

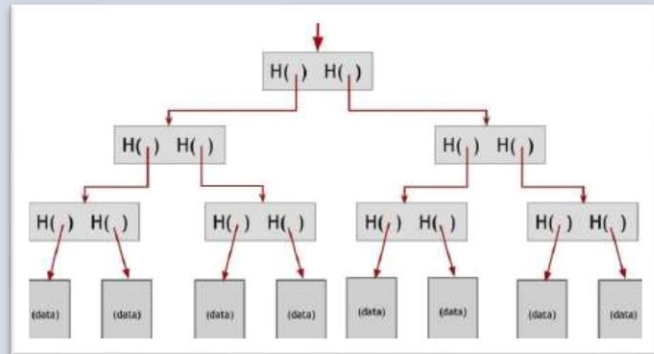

Smart contracts using Blockchain, with which to achieve :

Autonomous, anonymous, decentralized and open transaction coordination by distributing the encrypted transaction ledger to all nodes.

All contracts are hosted in multiple computer systems.

What is needed?

- Cryptography
- Merkle trees
- Miners
- Certificates
- Consensus

HYPERLEDGER FABRIC

What does it provide?

How is it deployed?

Red

Certificates

Channel

Nodes

Tests

Organizations.

Contract.

What is recorded in a Blockchain can no longer be changed and therefore, will it be correct?

True or *false*?

The data entered in a Blockchain
can they be changed later?

True or false?

Does blockchain allow cooperation between parties in the chain that don't trust each other?

True or *false*?

1. Usefulness is questionable.
2. Can be used as a control instrument
3. Its use can generate inequalities between members.

• Thank you
